page 1297

Principles for Implementing a Potential Solution to the Middle East Conflict  
page 1300

About the cover: Can mathematics help resolve serious conflicts? (see page 1343)
The November issue features several articles bearing on math education. These include a Doceamus on moving from the routine to the nonroutine in problem solving, a piece on the structure of U.S. elementary school mathematics, and an article on what secondary preservice math teachers need to know. In a historical direction, we have an article about the role of Cauchy's mean value theorem in the history of analytic rigor. Finally, there is an unusual article about the application of mathematical principles to the negotiation of peace in the Middle East.

page 1448

About the cover: Binomial coefficients in Al Bāhir fi Al-Jabr
(see page 1498)
We close the year with a variety of articles on diverse mathematical subjects. These include (i) hearing the shape of a triangle, (ii) the role of Soviet ideology in mathematics, (iii) the universality of teaching techniques in school mathematics, (iv) numerical experimentation on a quantum computer, and (v) the CBMS mathematics survey. Our goal is to treat all aspects of mathematics that may affect or interest the Notices readership.
